Selective electrochemical reduction of trichloroacetate using a Pd nanoparticle-modified electrode. The direct electrochemical reduction of trichloroacetate (TCA) is achieved using a Pd nanoparticle (Pd NPs) electrodeposited on a carbon paste electrode (CPE). TCA reduction proceeds smoothly at a lower potential (ca. -1.2 V vs. the standard hydrogen electrode (SHE) versus Ag/AgCl), with the reduction rate higher than that observed on a carbon electrode, in

#if DISABLESTYLECOP #endregion #endifRadiological diagnosis of lung cancer by means of a new fast-scan computed tomography technique: retrospective analysis of 53 patients. Fifty-three patients with suspected lung tumours on chest radiography or CT examination were

analysed for the CT criteria of malignancy. The CT technique was based on rapid scanning (single-step rapid cine CT technique, 0.67 sec/slice) and the findings were compared with the results of pathohistology. All benign pulmonary abnormalities could be differentiated. In 24 of the 28 malignant cases, CT was able to establish the tumour type with a high degree of accuracy. In four cases the diagnosis was only possible with a high degree of suspicion. The technique was not successful in the diagnosis of metastatic pulmonary tumours and the demonstration of lymph node metastases. The CT technique is suitable for screening and is a useful complement to other imaging techniques in the diagnosis of lung cancer.

Efficacy of the anti-inflammatories rizatriptan, a 5-HT_{1B/1D} receptor agonist, and/or the 5-HT₂ receptor antagonist, ketanserin, in migraine: a randomized, double-blind, placebo-controlled, crossover trial. The efficacy of a novel 5-HT(1B/1D) receptor agonist, rizatriptan, in migraine prophylaxis is reported in a randomized, double-blind, placebo-controlled, crossover trial. Migraine attacks were treated with either rizatriptan, 20 mg, or placebo, or a combination of rizatriptan and ketanserin, 10 mg. Relief of headache was achieved earlier with rizatriptan monotherapy than with ketanserin monotherapy, or rizatriptan plus ketanserin therapy. No difference in efficacy was seen between ketanserin monotherapy and rizatriptan plus ketanserin therapy.

The results support the suggestion that rizatriptan is effective in migraine prophylaxis.

Immunogenicity and safety of single-dose and low-dose 13-valent pneumococcal polysaccharide vaccine in infants: a phase III study. The immunogenicity and safety of a 13-valent pneumococcal polysaccharide vaccine (PPSV13) in infants were evaluated. A phase III, randomized, controlled, observer-

===== This package provides a tool, called `StyleCopAnalyzer`, that can be used to analyze C# source code for StyleCop compatibility issues. This tool can be run from inside of Visual Studio or integrated into an MSBuild project. It is recommended that you run this tool every time you add a new C# file to a solution, but not when adding a file to an existing solution (as the tool will analyze the existing files). To use this tool, first open the Solution Explorer, right-click on a solution folder, and select Properties. In the Properties dialog, expand the Build tab, select Configuration Properties, and select the Build Events page. In the Build Events dialog, enter the following line into the Post-Build Event box:

```
""$(ProjectDir)tools\StyleCopAnalyzer.exe"
```

```
""$(TargetDir)$(TargetFileName)""
```

Visual Studio will then run the StyleCop Analyzer tool before the build is executed. NOTE: This tool will change the properties of the C# project files to allow StyleCop compliance. It will not open the C# project files directly, just like it will not execute the `devenv.exe` file directly. Usage ===== To use this package: - Ensure that your solution is in the correct build configuration. - Ensure that StyleCop is installed on your computer. - Copy this package to the build folder of your solution. - Open the Solution Explorer, right-click on your solution folder, and select Properties. - Expand the Build tab, select Configuration Properties, and select the Build Events page. - In the Build Events dialog, enter the following line into the Post-Build Event box:

```
""$(ProjectDir)tools\StyleCopAnalyzer.exe"
```

```
""$(TargetDir)$(TargetFileName)""
```

Visual Studio will then run the StyleCop Analyzer tool before the build is executed. This package will then generate a StyleCop violations report which can be viewed in the

Output window. A very basic usage example can be found below. In this example, we are using a `TextClass` class to illustrate how to work with the StyleCop Analyzer tool. ``csharp using System; using System.IO; using System.Text; using Microsoft.Build.Evaluation; using Microsoft.Build.Engine.Plat
